

박수민_0611_LED 과제

1,2) led_shift_left_keepon, led_shift_right_keepon

main.c 주요코드

```
#if 1
int main(void)
{
    int button0_state=0;    // 초기 상태를 led all off로 출발 하자

    init_button();
    init_led();

    led_main();

    while (1)
    {
        // toggle  off <--> on
        if (get_button(BUTTON0, BUTTON0PIN))
        {
            button0_state = !button0_state;    // 반전  0 <--> 1
            if (button0_state)
                led_all_on();
            else led_all_off();
        }

        if (get_button(BUTTON1, BUTTON1PIN))
        {
            button0_state = !button0_state;
        }
    }
}
#endif
]
```

led.c 주요코드

```
void led_shift_left_keepon()
{
    for (int i=0; i<8; i++)
    {
        PORTA |= 1 << i;
        _delay_ms(300);
    }
}

void led_shift_right_keepon()
{
    for (int i=7; i>=0; i--)
    {
        PORTA |= 1 << i;
        _delay_ms(300);
    }
}
```

```
#include "led.h"
void init_led(void);
void led_all_on(void);
void led_all_off(void);
void led_shift_left_on(void);
void led_shift_right_on(void);
void led_shift_left_keepon(void);
void led_shift_right_keepon(void);
void led_flower_on(void);
void led_flower_off(void);
```

```
int led_main(void);
```

```
int led_main(void)
{
    led_all_off();

    while(1)
    {
        led_shift_left_keepon();
        led_all_off();
        led_shift_right_keepon();
        led_all_off();
    }

    return 0;
}
```
