

pointer 활용 합 /평균 구하기

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>

void cal_total_avg(int x, int y, int* total, double* avg);

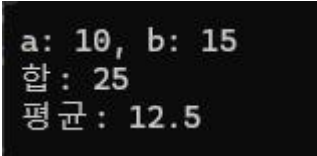

int main()
{
    int a = 10, b = 15, total;
    double avg = 0;

    cal_total_avg(a, b, &total, &avg);

    printf("a: %d, b: %d\n", a, b);
    printf("합: %d\n", total);
    printf("평균: %.1lf\n", avg);

    return 0;
}

void cal_total_avg(int x, int y, int* total, double* avg) {
    *total = x + y; // total에 x와 y의 합을 저장
    *avg = (double)(*total) / 2; // avg에 total의 평균을 저장
}
```

```
a: 10, b: 15
합: 25
평균: 12.5
```
